Лабораторный практикум

7-е издание

Минск БГМУ 2022

УДК 579:61(076.5)(075.8)-054.6
ББК 52.64я73
Ч-25

Рекомендовано Научно-методическим советом университета в качестве лабораторного практикума 20.04.2022 г., протокол № 4

А в т о р ы: доц. Д. А. Черношей; доц. В. В. Слизень; доц. Т. А. Канашкова; ассист. И. А. Гаврилова

Р е ц е н з е н т ы: канд. мед. наук, доц. В. Э. Бутвиловский; канд. мед. наук, доц. Е. И. Гудкова

Частная и клиническая микробиология = Special and clinical Ч-25 microbiology : лабораторный практикум / Д. А. Черношей [и др.]. – 7-е изд. – Минск : БГМУ, 2022. – 55 с.

ISBN 978-985-21-1032-7.

Содержит информацию для подготовки к практическим занятиям по разделам частной и клинической микробиологии. Приведены схемы, алгоритмы, справочные сведения, методики выполнения лабораторных работ. Первое издание вышло в 2015 году.

Предназначен для студентов 2-го курса медицинского факультета иностранных учащихся, обучающихся на английском языке.

Class № 1. **Microbiological diagnostics of diseases caused by staphylococci, streptococci, neisseria** **Date_____**

The subject to study:
Staphylococci, systematics, general characteristics. Methods of microbiological diagnostics of staphylococcal infections. The material for the research depending on the form of the infection. Scheme of pure culture isolation (from pus, mucus, blood, etc.). Identification methods, phage typing. Specific prevention and treatment of staphylococcal infections.
Streptococci. Systematics. Pyogenic streptococci. Pneumococci. General characteristics. Antigenic structure. Acute and chronic diseases, pathogenesis, immunity. Specific antibodies to streptococcal antigens, diagnostic value. Methods for streptococcal infections diagnosis. Bacteriological method, study design. Material for studies depending on the form of the infection, the rules and methods for taking material. Principles of therapy and prevention pro-streptococcal infections.
Neisseria. Systematics, general characteristics.
Characteristics of the causative agent, mechanisms of pathogenesis, immunity, methods of microbiological diagnosis of acute and chronic gonorrhea.
Characteristics of the causative agent, mechanisms of pathogenesis, immunity, diagnosis and prevention of meningococcal infection-howl. sources:

Laboratory work

Tasks	Methods, results
1. Microbiological diagnostics of staphylococcal infection, Step 2 a) macro- and microscopic examination of the colonies on YSA; b) plasmacoagulase test.	 Smear _____ _____ Stain_____ MSA (YSA) Stabilized rabbit plasma, 37 °C, 2–4–24 h. **Conclusion**: according to morphological, cultural and biochemical properties unknown bacterium is identified as

Feature	Staphylococcal colonies
Shape

Class № 2. **Microbiological diagnostics of acute enteric infections caused by enterobacteria** **Date**_____

Questions to study: General characteristics of Enterobacteriaceae family. Differences between genera. General principles of diagnostics of acute enteric infections caused by pathogenic enterobacteria. Differential diagnostic media, composition, plinciple of work.

Escherichia, systematic position, general characteristics. The biological role of Escherichia coli. Molecular mechanisms of escherihiosis pathogenesis. Enteropathogenic, enterotoxigenic, enteroinvasive and enterohaemorrhagic Escherichia coli. Escherihisis diagnostics. Antibiotic treatment.

Salmonella, classification and general characteristics. Serological classification of Salmonella. Identification of Salmonella. Molecular biological typing.

Causative agents of typhoid and paratyphoid. The pathogenesis of typhoid. Microbiological diagnostics of typhoid fever, depending on the stage of pathogenesis.

Laboratory work

Task	Methods, results
1. Bacteriological diagnostics of escherichiosis, 2-nd step: а) exploring of E. coli colonies on Endo and Levin media; б) slides preparation from colonies, Gram staining; в) slide agglutination test with polyvalent diagnostic OK-serum.	
Media	Endo	Levin

Class № 4. Microbiological diagnostics of diseases caused by Klebsiella, Iersinia, Campylobacter and pseudomonada. Methods for food poisoning diagnostics **Data_____.**

List of questions to study: Klebsiella, classification and general characteristics, main diseases caused. Pathogenesis, immunity, methods of microbiological diagnosis of acute and chronic klebsiellosis.

The causative agent of intestinal yersiniosis, general characteristics. Pathogenesis, immunity, methods of microbiological diagnostics.

Campylobacter, general characteristics, role in human pathology. Mechanisms of pathogenesis. Diagnosis of campylobacteriosis. Helicobacter.

Pseudomonas aeruginosa, general characteristics, pathogenicity factors, role in human pathology. Methods of microbiological diagnostics Pseudomonas infection.

Classification, etiology of food poisoning. Principles of microbiological diagnostics.

Laboratory work

Tasks	Methods, results
1. Independent work "Microbiological klebsiellosis diagnostics": A. Examine the growth of Klebsiella on differential-diagnostic media. B. Determine the capsule presence. C. Determine the biochemical properties of Klebsiella. D. Perform slide agglutination test with anti-capsule diagnostic sera and determine the K-antigen. E. Determine the titer of CFT for serological diagnosis of scleroma.	
Klebsiella characteristics

Diagnosis of bacterial food poisoning

Food poisoning - acute systemic diseases resulting from ingestion of food, massively contaminated with microorganisms or microbial exotoxins. Food poisoning is divided into bacterial foodborne diseases and food poisoning (toxicosis), as well as poisoning of mixed etiology.

Foodborne diseases (FBD): FBDs result from ingestion of products massively colonized by certain bacteria. Pathogens: opportunistic members of the family Enterobacteriaceae - E. coli, Proteus (P. vulgaris, P. mirabilis), Morganella morganii, Citrobacter, Enterobacter, Hafnia, Klebsiella pneumoniae; Sem. Vibrionaceae - V. parahaemolyticus; Sem. Bacillaceae - B. cereus, C. perfringens serovar A; Sem. Streptococcaceae - S. faecalis; Sem. Pseudomonadaceae - P. aeruginosa, and others.	**Microbial food toxicosis (intoxication):** acute illness arising from eating food, which containes a large amount of exotoxin (as a result of massive reproduction of microbes). These include botulism, toxicosis caused by staphylococcal enterotoxin, toxins from microscopic fungi and others.
Pathogenesis. Pathogen replicates in the intestine, penetrates into lymphoid tissue, where it is killed with the release of endotoxin, which causes damage to the intramural bowel NS, CNS and blood vessels. Bacteria cause inflammation of the intestinal wall.	**Pathogenesis** is based on the microbial exotoxin, which is not destroyed by food processing, digestive enzymes and acidic stomach contents.

Materials for the research: vomit, stomach washings, feces, urine, blood, sectional material (in the case of death), the remains of the suspected food, raw and semi-finished products used, daily samples of food, swabs and scrapings from kitchen utensils.

Lab. diagnosis: isolation of obligate pathogenic or opportunistic enterobacteria and Vibrio, staphylococci and their toxins, streptococci, bacillus, as well as (if indicated) - botulism pathogens and toxins.

To evaluate the etiologic role of opportunistic bacteria (OB) certain criteria are used.

Main criterion is quantitative: Etiologically significant number of OM is 10^5-10^6 or more CFU per 1g of material. The diagnosis is more reliable while simultaneous detecting same germs or toxins in suspected food. Other criteria are: repeated isolation of same germs from the material of the patient, the identity of the pathogen strains (serovars and phage-vars) in a large number of patients in group food poisoning, as well as the increase in antibody titer in the dynamics of the disease.

Class № 5. **Microbiological diagnostics of diseases caused by Corynebacteria, bordetella, haemophilus, legionella, listeria Date_____**

List of questions to study:

Corynebacterium diphtheria. Systematics, general characteristics of the pathogen. Types of Corynebacterium diphtheria, their distinctive features. Diphtheria toxin and antitoxic serum. The pathogenesis of diphtheria. Methods of microbiological and molecular biological diagnosis of diphtheria. Principles of therapy and prevention of diphtheria. Determination of the effectiveness of post-vaccinal immunity.

Bordetella pertussis. Characteristics of the pathogen, pathogenicity factors. Differentiation with parapertussis agent. The pathogenesis of pertussis, immunity, diagnostics. Principles of therapy and prevention of pertussis.

Haemophilus, general characteristics, role in human pathology.

Legionella, general characteristics, role in human pathology.

Listeria, general characteristics, role in human pathology.

Laboratory work

Tasks	Methods. results
1. Bacteriological diagnosis of diphtheria, 2nd step: a) Describe the colonies Corynebacterium on potassium tellurite serum agar b) Seed bacteria from typical colonies onto Hiss media (glucose, sucrose, starch).	Demonstration. 1. Corynebacterium diphtheriastained by: a) Neisser; b) Leffler. 2. Test for Corynebacterium diphtheria toxigenicity. 3. Preparations for specific prevention and treatment of diphtheria and pertussis. 4. Growth of Bordetella pertussis and parapertussis on CCA, NA with tyrosine, urease test. 5. Bordetella pertussis, Gram staining 6. Assessment of antidiphtheria immunity intensity	
Feature	Colonies on serum tellurite agar

Corynebacterium characteristics

Properties	*C. diphtheriae*
Morphology (size, shape, relative positions of cells)	
Spores development	
Capsule	
Flagella (motility)	
Gram staining	
Pathogenicity factors	

Medically important corynebacteria

Species	Diseases
C. diphtheriae	Diphtheria
C. ulcerans, *C. minutissimum, C. xerosis, C. pseudodiphtheriticum*	Opportunistic infections

C. diphtheriae pathogenicity factors

Pathogenicity factors	Biological effect
Protein exotoxin (includes A and B subunits)	Protein synthesis arrest, specific damage of the myocardium, adrenal glands and nerve ganglia
Glycolipid (6-6'-diester-trehalose)	Phagocytosis impairment
Hyaluronidase	Permeability of tissues violation
Neuraminidase	

Laboratory diagnostics and specific prophylaxis of diphtheria

Method	Properties
Microscopic	
Cultural	
Molecular-genetic	
Specific prophylaxis	

Bordetella pertussis characteristics

Properties	*B. pertussis*
Morphology (size, shape, relative positions of cells)	
Spores development	
Capsule	
Flagella (motility)	
Gram staining	

Bordetella differentiation

Feature	*B. pertussis*	*B. parapertussis*

***B. pertussis* pathogenicity factors**

Pathogenicity factors	Biological effect
Filamentous hemagglutinin	Binds cell membrane glycolipid of ciliated airway epithelium, binds surface R3 - glycoprotein receptor and initiates phagocytosis
Pertussis toxin (Pertussin)	S1 Pertussin subunit ribosylates membrane protein Gi; toxin inhibits the activity of phagocytes and monocyte migration. S2 - subunit binds to the respiratory tract cell surface glycolipid; S3 - subunit binds to phagocytes surface gangliosides
Pili	Adhesion to the ciliated epithelium of the respiratory tract
Pertactin	Adhesion to the ciliated epithelium of the respiratory tract
Adenylate cyclase	Suppresses killing- activity of phagocytes and monocytes migration
Dermatonekrotoksin	Damages the skin and is lethal to laboratory animals
Tracheal toxin	peptidoglycan fragment - destroys ciliated cells of the respiratory tract; stimulates interleukin-1 secretion (fever)
Endotoxin (LPS)	Activates complement and stimulate the production of cytokines

Laboratory diagnostics and specific prophylaxis of pertussis

Method	Properties
Bacteriological	
Serological	
Specific prophylaxis	

***Haemophilus* genus representatives and respective diseases**

Species	Diseases
H. influenzae	
H. ducreyi

Morphology	
Spores development	
Capsule	
Flagella (motility)	
Gram staining	
Antigens	

***H. influenzae* pathogenicity factors**

Pathogenicity factors	Biological effect
Polysaccharide capsule	Inhibition of phagocytosis
Pili and other adhesins	Attaching to epithelial cells
Lipopolysaccharide and glycopeptide	Epithelium surface and cilia damage
Ig A protease	Suppression of local immunity

Laboratory diagnostics and specific prophylaxis of infections caused by *Haemophilus*

Method	Properties
Microscopic	
Cultural	
Serological	
Specific prophylaxis	

Legionella characteristics

Properties	*Legionella pneumophila*
Morphology (size, shape, relative positions of cells)	
Spores development	
Capsule	
Flagella (motility)	
Gram staining	

***Legionella pneumophila* pathogenicity factors**

Pathogenicity factors	Biological effect
1. Optional intracellular parasitism	
Toxin (peptide)	inhibiting the "oxidative burst" during phagocytosis
Catalase	inactivation of toxic metabolites during macrophage activation
Factors of unknown nature	inhibit fusion of phagosomes and lysosomes, electron transport
2. Production of toxins, enzymes	
Labile exotoxin (Cytotoxin and hemolysin)	dysfunction or cell lysis
Endotoxin	dysfunction or cell lysis
Proteolytic enzymes: phosphatase, lipase, nuclease	degradation of host cells
3. Suppression of the expression of MHC class II molecules on macrophages, violation of Ag-presenting functions - the suppression of cellular immune response	

Laboratory diagnostics and specific prophylaxis of legionellosis

Method	Properties
Microscopic	
Cultural	
Serological	
Molecular-genetic

Pathogenicity factors		Biological effect
toxins	endotoxin	general toxic effect
	leukocidin	damages leukocytes
enzymes	collagenase	destroys the collagen fibers of the connective tissue (spread of purulent process)
	DNAse, heparinase	cause intravascular blood clotting
	fibrinolysin	dissolves blood clots

Clostridia characteristics

Characteristics	*C. perfringens*	*C. tetani*	*C. botulinum*
Morphology (size, shape, relative positions of cells)			
Spores development			
Capsule			
Flagella (motility)			
Gram staining			
Pathogenicity factors			

Clostridium perfringens pathogenicity factors

Pathogenicity factors		Biological effects
Main toxins	alpha-toxin (Lecithinase)	cleaves lecithin in cell membranes; increases vascular permeability destroying erythrocytes; necrotizing activity
	beta-toxin	necrotizing activity; induction of hypertension as a result of formation of catecholamines
	epsilon toxin	increases vascular permeability of the gastrointestinal tract
	Iota toxin	necrotizing activity and increased vascular permeability
	enterotoxin	violates the permeability of the mucosa of the small intestine
Minor toxin	delta-toxin	hemolysis
	theta toxin	hemolysis, cytolysis
	kappa toxin	collagenase, gelatinase, necrotizing activity
	lambda-toxin	protease
	mu-toxin	hyaluronidase: increases the permeability of tissues
	nu-toxin	DNAse; hemolytic, necrotizing activity
	neuraminidase	damages gangliosides cell receptor, promotes thrombosis in capillaries

	beta-lactamase	destroys the beta-lactam antibiotics
surface cell structure	pili	adhesion to the substrate
	capsule	protects the bacteria from phagocytosis
Metabolites	fatty acid	inhibit the chemotaxis and cytotoxicity of leukocyte

Pathogenicity factors	Biological effects
Botulinum exotoxin	Blocks the transmission of nerve impulses in the peripheral cholinergic synapses, providing neurotoxic effects (lethal dose for humans is about 0.3 g)

Microbiological diagnostics and specific prophylaxis of botulism

Methods	Remarks
Serological	
Biological	
Cultural	
Specific prophylaxis	Botulinum toxoids A, B, E, are used according to indications. For urgent passive prophylaxis specific antitoxic serum is used.

Class № 7. **Microbiological diagnostics of especially dangerous infections** **Date**_____

The list of questions to study:

Classification and general characteristics of the especially dangerous infections. Demands to collection and transportation of biological material. Principles of diagnostics.

Vibrio cholerae, the systematic position. Classification and general characteristics, pathogenicity factors. Biovars. Differentiation from non-cholera vibrio. Pathogenesis of cholera. Methods of microbiological diagnostics. Rapid methods. Principles of treatment and prevention.

The causative agent of plague, systematic position, characteristics, pathogenicity factors. Differences from other Yersinia. Pathogenesis, principles of treatment and prevention of plague.

The causative agent of tularemia, systematics, general characteristics. Pathogenesis, principles of treatment and prevention.

Causative agents of brucellosis. Systematics and general characteristics, pathogenicity factors, pathogenesis. Microbiological diagnosis of brucellosis. Principles of treatment and prevention.

Anthrax. Systematics and general characteristics, pathogenicity factors. Differences from non-pathogenic bacilli. Pathogenesis. Microbiological diagnosis of anthrax. Principles of treatment and prevention.

Laboratory work

Tasks	Methods, results
Demonstration. 1. Growth of vibrio cholera on alkaline agar, TCBS, peptone water. 2. Phage lysability of vibrio cholera classica and El Tor. 3. Tube agglutination test. 4. Biochemical properties of V. cholerae. 5. Mobility of Vibrio spp. 6. V.cholera, pure culture, Gram staining. 7. I.pestis in the organs, Leffler staining. 8. The causative agent of tularemia (pure culture), Gram staining. 9. Preparations for specific prophylaxis of especially dangerous infections. 10. The causative agent of brucellosis, Gram staining. 11. The growth of Bacillus spp. on nutrient media. 12. B.anthracis in organs, Gram staining. 13. B.anthracis, pure culture, Gram staining. 14. B.anthracis spores, Ozheshko staining. Class № 8 Microbiological diagmostics0f diseases caused by spirochetes **Date_____**

List of questions to study:

Spirochetes, classification, general characteristics.

Treponema. Systematics and general characteristics. Pathogenesis and immunity in syphilis. Material for the study. Methods of microbiological diagnosis of syphilis. Principles of therapy and prevention of syphilis.

Fusospirochetosis pathogens

Leptospira. Systematics and general characteristics. Pathogenesis, methods of microbiological diagnostics, principles of treatment and prevention of leptospirosis.

Borrelia. Systematics and general characteristics. Pathogenesis and methods of microbiological diagnosis of relapsing fever. The causative agent of Lyme borreliosis, principles of treatment and prevention.

Laboratory work

Tasks	Methods, results
1. Perform the slide microprecipitation reaction (VDRL) for the syphilis serodiagnosis. 2. Assess ELISA (Wasserman test) for the syphilis diagnostics.	**Slide microprecipitation test**  1. Patient serum 1:20 2. Saline sol. 3. Cardiolipin Ag Conclusion:_____

Demonstration.

1. Leptospires, dark field microscopy.
2. Borrelia in blood, Romanovsky-Giemsa staining.
3. Wasserman test (ELISA).
4. Treponema in dental plaque, Gram staining.
5. Treponema pallidum, pure culture, Romanovsky-Giemsa staining.

Pathogenesis of syphilis

Disease stage	**Period**	**Main pathogenetic mechanisms**
Primary		
Secondary		
Tertiary		

Serological diagnosis of syphilis:

CFT (Wasserman) with treponemal and cardiolipin antigens in primary syphilis becomes positive in the 6th week of the disease in 25-50% of patients, in 7-8 weeks - 75-90%. In secondary syphilis it is positive in 98-100% cases. In tertiary syphilis CFT is positive in only 60-70% patients. CFT for syphilis diagnostics has unsatisfactory sensitivity and specificity and is replaced now by ELISA.

ELISA is the common used technics for syphilis diagnostics.

Confirmatory tests:

– treponema immobilization test is rather specific, but time and labor consuming, subjective, requires treponema culture;

– immunofluorescence (IF) with serum from patients.

Screening tests: slide microprecipitation test, ELISA

Laboratory diagnosis of Lyme disease (Lyme borreliosis):

Microscopic method: dark-field microscopy (scrapings of skin lesions, plasma pellet, CSF, urine), microscopy of smears, impregnated with silver, IFT, and electron microscopy.

Cultural method: B. burgdorferi isolation is possible in 80% cases from skin lesions (1stage) on special nutrient media.

Molecular genetic methods: PCR allows the identification of the pathogen's DNA in the samples of the skin, blood, cerebrospinal fluid.

Serological: ELISA, indirect IFT, Western blot. Sometimes there are false-positive results due to cross-reactions among patients with syphilis, mononucleosis, rheumatoid arthritis and others.

Class № 8. **Microbiological diagnostics of diseases caused by Rickettsia, Chlamydia and Mycoplasma** **Date**_____

List of questions to study:

Rickettsiae, systematic position, classification, general characteristics, role in human pathology. Rickettsia typhii, pathogenesis, immunity and methods of microbiological diagnostics. Other pathogenic rickettsia.

Chlamydia, general characteristics, role in human pathology. Pathogens of psittacosis, trachoma, respiratory and urogenital chlamydiosis. Methods of microbiological diagnosis of chlamydiosis. PCR in chlamydiosis diagnostics.

Mycoplasma, general characteristics, role in human pathology. Methods of microbiological diagnostics of mycoplasmoses.

Actual classification of Rickettsia:

On the basis of a molecular genetic studies (genome sequencing, PCR) classification of microorganisms belonging to the order Rickettsiales has undergone significant changes. The genus Coxiella with C.burnetti was excluded from the family and added in the order Legionellales, family Coxiellaceae. Genus Rochalimaea was removed, and its representatives - R. quintana (Trench fever) and R. henselae (cat scratch disease) were included in the family Bartonellaceae, genus Bartonella.
The family Rickettsiaceae now include three genera: Rickettsia, Orientia, Wolbachia. The medical importance of the latter genus is still unclear.

Class № 9 **Concluding test "Special microbiology"** **Date**_____

1. Staphylococci, general characteristics. Role in human pathology. Pathogenicity factors and mechanisms of pathogenesis of staphylococcal infections. Microbiological diagnosis. Principles of treatment and prevention of staphylococcal infections.
2. Streptococci, classification. General characteristics. Pathogenicity factors. Antigenic structure. Pathogenesis, immunity, microbiological diagnosis, principles of treatment and prevention of streptococcal infections.
3. Classification of Neisseria. Meningococcus, general characteristics. Meningococcal infections, mechanisms of pathogenesis, immunity, methods of diagnosis, prevention.
4. Gonococci, general characteristics. Mechanisms of pathogenesis and immunity. Microbiological diagnosis of acute and chronic gonorrhea.
5. General characteristics of the family Enterobacteriaceae.
6. General Principles of bacteriological diagnosis of acute intestinal infections (AII). The nutrient medium for enterobacteria. Classification principles of application.
7. Materials for researches in AII diagnostics.
9. E. coli, common characteristic. The biological role of Escherichia coli. Diseases caused by Escherichia.
10. Salmonella. General characteristics. Members of the genus. Serological classification by Kaufmann-White. Molecular biological typing.
11. Pathogens of typhoid, paratyphoid A and B, general characteristic. Phage typing. Vi-antigen and its value.
12. Pathogenesis and methods of microbiological diagnosis of typhoid and paratyphoid.
13. Immunity in typhoid fever. Serological diagnosis of typhoid and paratyphoid. Specific prophylaxis.
14. The etiology of food poisoning and intoxication of bacterial origin. Materials and methods of diagnosis.
15. Salmonellosis. Characteristics of pathogens and diagnostic methods. Nosocomial salmonellosis.
16. Shigella. Classification. Characteristics. Pathogenesis, immunity. Methods of microbiological diagnostics of acute and chronic dysentery.
17. Klebsiella. Classification, general characteristics. Pathogenesis, immunity, methods of microbiological diagnostics of klebsiellosis.
18. Pseudomonas aeruginosa, general characteristics, pathogenicity factors. Role in human pathology.
19. Pathogens of intestinal yersiniosis, general characteristics. Pathogenesis. Methods of diagnosis of yersiniosis.
20. C.diphtheria, general characteristics. Differences from non-pathogenic corynebacteria. Mechanisms of pathogenesis and microbiological diagnosis of diphtheria.
21. Diphtheria toxin and its properties. Toxoid. Immunity in diphtheria and its character. Determination of antitoxic immunity. Principles of therapy and prevention of diphtheria.
22. The causative agent of whooping cough, general characteristics. Differentiation with parapertussis agent. Pathogenesis, immunity. Microbiological diagnosis, principles of treatment and prevention of pertussis.
23. General characteristics of the causative agents of tuberculosis. Pathogenesis, immunity, diagnosis and specific prevention of tuberculosis. Mycobacteriosis.
24. The causative agent of leprosy. Characteristic, pathogenesis, immunity.

25. Particularly dangerous infections. classification mode, Basic rules of sampling, sending and transportation of infectious material General principles of diagnosis TELO.
26. V. cholera. Systematics. General characteristics. Differentiation of biovars. Pathogenesis, immunity, principles of treatment and prevention. Methods of microbiological diagnostics.
27. The causative agent of plague, a general characteristic. The pathogenesis of plague. Immunity, the principles of therapy and prevention of plague.
28. B. anthracis characteristic. Pathogenesis, immunity, principles of treatment and prophylaxis of anthrax.
29. The causative agent of tularemia, general characteristic. Pathogenesis, immunity, principles of treatment and prophylaxis of tularemia.
30. Pathogens of brucellosis, a general characteristic. Differentiation of Brucella species. Pathogenesis, immunity, principles of treatment and prevention of brucellosis.
31 Spirillae family. Campylobacter, characteristics, role in human pathology. Helicobacter.
32. Classification and general characteristics of anaerobes. Clostridia. Bacteroides, Peptococci and other nonspore anaerobes. Pathogenicity factors. Role in human pathology.
33. The causative agent of tetanus, general characteristics. Pathogenesis, immunity, principles of treatment and prevention of tetanus.
34. Gas gangrene pathogens, general characteristics. Pathogenesis, principles of treatment and prevention of gas gangrene.
35. The causative agent of botulism, general characteristic. Pathogenesis, principles of botulism prevention and therapy. Clostridial gastroenteritis.
36. Methods of diagnosis of anaerobic infections.
37. Classification and general characteristics of spirochetes.
38. Classification of treponemes and treponemal diseases. Characteristics of syphilis causative agent. Pathogenesis, immunity, diagnostic tests for syphilis.
39. Leptospires. General characteristics. The pathogenesis of leptospirosis, immunity, specific prevention. Microbiological diagnosis of leptospirosis.
40. Borrelia, general characteristics. Recurrent fever pathogenesis, immunity. Microbiological diagnosis. The causative agent of Lyme borreliosis.
41. Systematic position and characterization of Rickettsia. Pathogenesis, immunity, methods of diagnosis of typhus.
42. Characteristics of chlamydia. Causative agents of trachoma, psittacosis, respiratory and urogenital chlamydiosis. Pathogenesis and methods of diagnosis of chlamydia.
43. General characteristics of mycoplasma, pathogenicity factors, role in human pathology. Methods of mycoplasmosis diagnosis.

Practical skills:
1. Determine the morphology of Staphylococcus, pure culture, Gram stain.
2. Determine the morphology of streptococcus, pure culture, Gram stain.
3. Determine the morphology of gonococci in pus, Gram stain.
4. Determine the morphology of enterobacteria, pure culture, Gram stain.
5. Determine the morphology of the mixture of S.aureus and Escherichia coli, Gram stain.
6. Determine the morphology of B.anthracis, pure culture, Gram stain.

7. Determine the morphology vibrio, pure culture, Gram stain.
8. Determine the morphology of Brucella, a pure culture, Gram stain.
9. Determine the morphology corynebacteria, pure culture, Leffler stain.
10. Determine the morphology of Klebsiella, pure culture, Hins-Burri stain.
11. Determine the morphology of mycobacteria in sputum, Ziehl-Neelsen stain.
12. Determine the biochemical properties of enterobacteria on Kligler iron agar medium.

Class № 10. **Clinical microbiology. Microbiological diagnostics of sepsis and purulent infections of the skin** **Date_____**

List of questions to study:

Clinical Microbiology: definition, objectives. Opportunistic microbes (OPM). Epidemiology, pathogenesis, diagnosis of diseases caused by UPM. Criteria of etiological significance.

Clinical forms and the etiology of septic infections of the skin and subcutaneous tissue. Methods of microbiological diagnostics.

Bacteriological method. Material for the research (pus, exudate), rules and methods of sampling. Criteria for assessment of the etiological significance of isolated microorganisms. Susceptibility to antibiotics.

Bacteremia. Sepsis. Pyosepticemia. Etiology, definitions. Methods of microbiological diagnosis of sepsis. Bacteriological method. Rules and methods of blood collection for the research, peculiarities of pathogen isolation and results interpretation Susceptibility to antibiotics testing.

Laboratory work

Hospital acquired infections (HAI, nosocomial infections) - any clinically recognizable infection contracted by patient due to residence or receiving various types of inpatient and outpatient medical care, the delivery of emergency medical services both in health care organizations and at home, as well as infectious disease contracted by medical staff as a result of professional activity, regardless of time of symptoms onset.

Nosocomial infections should be distinguished (introduced) from cases of infectious diseases registered in the delivery of health care in inpatient, outpatient medical institutions, or at home. Their main features are: the absence of a causal connection with the performance of therapeutic and diagnostic procedures and manipulations; acquisition of infection within the minimum incubation period before seeking medical help.

Etiology (main pathogens) of nosocomial infections

1.
2.
3.
4.
5.

CLASSIFICATION of HAI

HAI etiology includes bacteria; viruses; fungi; protozoa and metazoa.

By source of infection HAI can be exogenous; endogenous and auto-infection.

Depending on the profile of medical care nosocomial infections are divided into: surgical infection, obstetric infections; neonatal infections; other infections.

Depending on the entrance gate and localization of infection nosocomial infections are divided into: surgical wound infections; burn wound infection; infections of skin and soft tissue; primary bloodstream infections; sepsis; cardiovascular system infection; bone and joint infections; eye infection; ear infections; infection of the nose, throat, mouth and upper respiratory tract; lower respiratory tract infections; pneumonia; infections of the central nervous system; urinary tract infections; infections of the reproductive system; infections of the gastrointestinal tract.

Depending on the type of pathogen nosocomial infections are divided into: caused by obligate pathogens and opportunistic pathogens.

Depending on the spread in the organism HAI can be divided into: localized; generalized and systemic infections.

Depending on the course character nosocomial infections are divided into: acute; subacute and chronic.

By severity nosocomial infections are divided into: pathogen caring; mild; moderate and severe form.

Depending on the mechanisms, ways and factors of transmission of nosocomial infections are divided into: aerosol; contact (direct and indirect); parenteral; fecal-oral (food and water).

Class № 12. **Microbiological diagnostics of fungal and protozoan imfections** **Date**_____

The list of questions to study:

General characteristics and classification of protozoa. Pathogenic representatives. Laboratory diagnosis of malaria, toxoplasmosis, amebiasis, giardiasis, trichomoniasis.

The causative agent of cryptosporidiosis.

Classification and general characteristics of fungi. Pathogens of ringworm, keratomycosis, deep mycoses. Candidiasis and conditions which promote its development. General principles of fungal infections diagnostics.

Pathogen of pneumocystosis.

DIAGNOSTICS OF MYCOSIS

Microscopic method. High diagnostic value of the method caused by significant differences in fungal morphology, simplicity and speed of the research. The result can be obtained within 1-2 hours. Microscopy can be conducted in native preparations without staining. For visualization of the pathogen in the biological material which is poorly transparent (hair, skin, nails, etc.) it should be processed with 10-20% alkaline (KOH), which dissolves keratin and has no effect on the morphology of the fungal cells. Fixed smears may be stained by Gram (fungi are Gram-positive), Romanovsky-Giemsa, special techniques. Dimorphic fungi in biological material are in the form of yeast. Microscopy of histological preparations is also possible.

Serological method:

Immunofluorescence is sensitive, specific and rapid method based on the identification of fungal Ag in biological materials.

PHAT, latex agglutination, PT, CFT, ELISA are used to detect fungal antigens and antibodies in blood, CSF, urine. Serological reactions not always highly specific, but produce results earlier than culture method.

Culture (mycological) method. Most pathogenic fungi are mesophiles (20-45 °C) and not demanding for the nutrient medium. Optimal pH ranges from 4.0 to 6.5. Growing time depends on the kind of fungus and can be from several weeks to 2-3 days. The most frequently used medium is Saburo agar (peptone agar with glucose or maltose). The acidity of the medium and high carbohydrate content inhibits the growth of bacteria. Dimorphic fungi (pathogens caused subcutaneous and deep mycoses) grow in the mycelial form at 20-25 °C. The identification of a pure culture is carried out by morphological and biochemical characteristics.

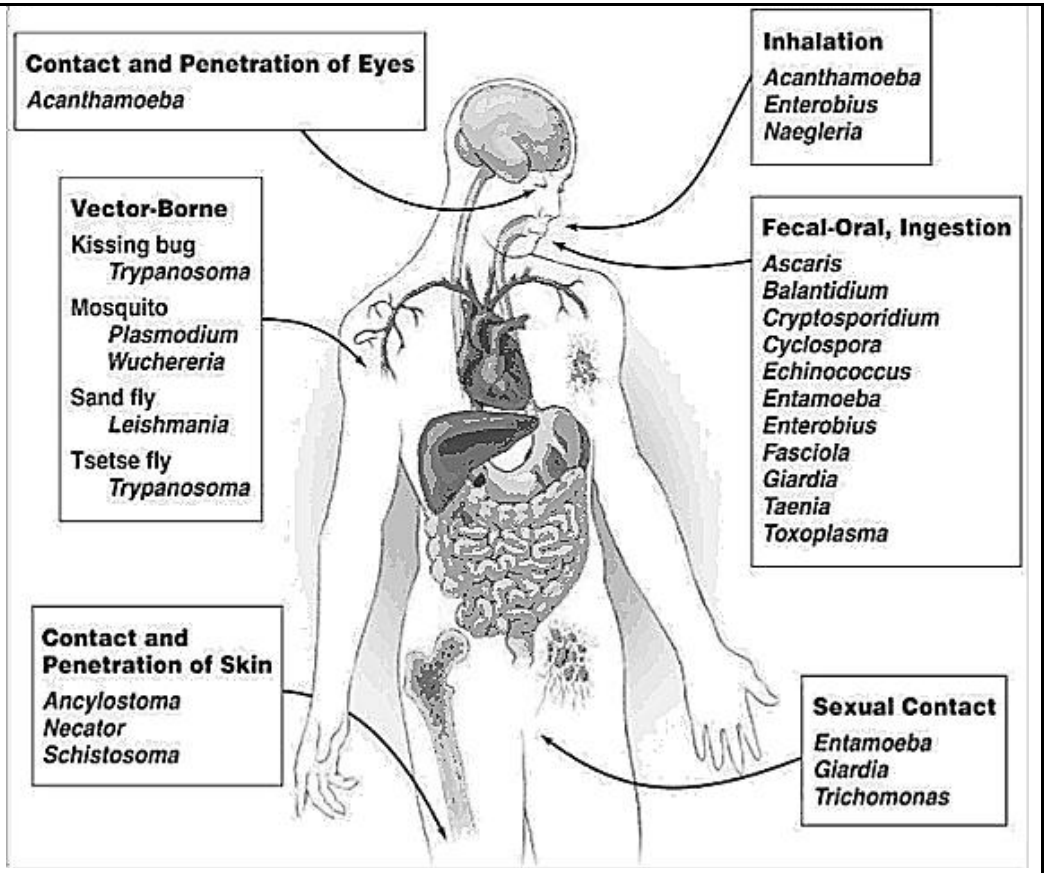
Allergic method. Skin tests are performed with fungal allergens (eg. Candide). Method is not very specific because of the group antigens presence.

Biological method. Bioassays in laboratory animals allow us to estimate the virulence of the pathogen, get in tissue culture of the fungus (usually in a form of yeast).

Molecular genetic methods. PCR and molecular hybridization are used. Among advantages - very high sensitivity and specificity, relative safety and short time needed for results.

The comparison of eu- and prokaryotic cell

Main characteristics	Prokaryotic cell	Eukaryotic cell
Cell size	Average 0,2-2,0 mkm	
Nucleus	Does not have a true nucleus. Nucleoid, is not separated from the cytoplasm by a membrane	
Chromosomes	Ring-like	
Number of chromosomes per cell	Usually one	
Mitochondria	No	
Endoplasmatic reticulum	No	
Ribosomes location	Dispersed in cytoplasm	
Sedimentation constant	70S	
Teichoic asides in cell wall	Gram positive bacteria	
Peptidoglycane in cell wall	All bacteria with exception of mycoplasm	
Endospores	Some has	
Division of cell	Binary (mitosis)	
Gametes, zygotes	No	



Main routs of pathogenic parasites invasion

Protozoa belong to the domen – *EUKARYA*, kingdom – *ANIMALIA*, subkingdom– *PROTOZOA*, which includes 7 types, Four types of medical importance are showed in the tableи

Taxons	Representatives	Disease	Morphology
TYPE *SARCOMASTIGOPHORA* subtype *Sarcodina*	**AMOEBAE** *Entamoeba histolytica*	Amebiasis		Naegleria, acanthamoeba, hartmanella	Amoebic meningoencephalitis, keratitis	
subtype *Mastigophora*	**LEISHMANIA** *Leishmania species*	Leishmaniasis		TRYPANOSOMES *Tripanosoma gambiense, Tripanosoma rodesiense Tripanosoma cruzi*	African trypanosomiasis (sleeping disease) Chagas disease (American trypanosomiasis)		GIARDIA: *Lamblia intestinalis (Giardia lamblia)*	Diarrhea, malabsorption syndrome	
	<u>Trichomonas</u> *Trichomonas vaginalis*	Trichomonas vaginalis vaginitis, urethritis, prostatitis	<u>TYPE –</u> ***<u>APICOMPLEXA</u>*** class – *Sporozoa*	**<u>PLASMODIUM MALARIA:</u>** *Plasmodium vivax* *Plasmodium ovale* *Plasmodium malariae* *Plasmodium falciparum*		

	<u>TOXOPLASMA:</u> *Toxoplasma gondii*	Toxoplasmosis		<u>SARCOCYST:</u> *Sarcocystis species*	Sarcocystosis		<u>ISOSPORA:</u> *Isospora species*	Diarrhea		<u>CRYPTOSPORIDIUM:</u> *Cryptospodium species*	Diarrhea		<u>CYCLOSPORA:</u> *Cyclospora cauetanensis*	Diarrhea		<u>BABESIA:</u> *Babesia species*	Babesiosis	
TYPE – CILIOPHORA class *Kinetofragminophorea*	**BALANTIDIUM:** *Balantidium coli*	Balantidiasis	TYPE – MICROSPORA class *Microsporea*	**MICROSPORIDIA:** *Encephalitozoon species* *Enterocytozoon species*	Microsporidiasis		BLASTOCYST: *Blastocystis hominis*		
MICROBIOLOGICAL DIAGNOSTICS OF PROTOZOAN INVASIONS

AMEBIASIS **Microscopic method**. Materials: samples of faeces or exudates from abscesses. Smears are stained with iodine solution or hematoxylin. Tissue forms with phagocytized erythrocytes or quad cysts. can be identified. In native specimens characteristic motile vegetative forms can be noted. IF may be used for the identification of pathogen **Serological method**: PHA test, ELISA, CFT, and other tests may be used. The highest antibody titer can be detected in extraintestinal amebiasis. Some non-pathogenic amoeba are morphologically identical to Entamoeba histolytica. The differentiation is based on the enzymatic, immunological and molecular genetic analysis.	**LEISHMANIASIS** **Microscopic method**. Materials: skin lesions (bumps, ulcers), bone marrow. Smears are stained by Romanovsky-Giemsa method. The detection of amastigote (nucleus and kinetoplasts are of red-purple color and cytoplasm is bluish) is of importance. IFT is also used. **Cultural method**. Leishmania can be cultured on blood agar. **Biological method**. Infection of mice or hamsters is possible. **Serological method**. Specific antibodies may be detected by CFT, passive hemagglutination or ELISA. **Allergic method**. Skin test with leishmania Ags may be used.
TRYPANOSOMES **Microscopic method**. Materials: samples of blood, punctate from cervical lymphatic nodes, cerebrospinal fluid. Smears are stained by Romanovsky-Giemsa method. **Cultural method**. Trypanosomes can be cultured on a nutrient medium with blood as well as in white mice or rats. **Serological method**. The determination of specific IgM by ELISA is used.	**GIARDIASIS** Microscopic method. Materials: feces, duodenal secretion. In smears cysts or vegetative forms, can be detected. Iodine staining is usually used. IFT is also applicable. Cultural method. Giardia can be cultured nutrient media. Serological method. Specific antibody titers are higher in symptomatic giardiasis.
TRICHOMONIASIS **Microscopic method**. Materials: samples from urethral discharge, prostatic secretions or urine sediment are studied. Smears are stained by Romanovsky-Giemsa (trophozoite nucleus is violet-ruby, cytoplasm - blue and blefaroplast, flagella and aksostil - pink-red), methylene blue. IF is also used. **Cultural method**. In chronic trichomoniasis pathogen can be cultured on nutrient media with protein. The method gives good results when confirmation of convalescence is needed.	**MALARIA** **Microscopic method**. Smears of blood are stained by Romanovsky-Giemsa method. Various forms of pathogen can be identified (red nucleus, blue cytoplasm). Differentiation of species is carried out by morphological features of parasites and parasitized erythrocytes. **Serological method**. Specific antibodies are detected by ELISA. IFT is applicable for diagnostics. **Molecular genetic method**. PCR.
TOXOPLASMOSIS **Microscopic method**. Materials: biopsy, samples of body fluids (blood, cerebrospinal fluid, lymph node puncture, etc.). Smears are stained by Romanovsky-Giemsa method. Toxoplasma Ags may be detected by IF test. **Cultural method**. Cultivation of Toxoplasma is possible in cell cultures and chicken embryo. **Serological method**. Detection of specific IgM indicates the early stages of the disease. IgG peaks at 4-8 week of disease. ELISA is widely used. **Biological method**. Mice are infected in the abdominal cavity or intracranially. They usually succumb 7-10 days after infection. The pathogen is identified microscopically or by serological method.	**BALANTIDIASIS** Microscopic method. Microscopy of smears from feces under low magnification allows to reveal large motile balantidiums. Cultural method. Possible, but rarely used
