Introduction

While many books and literature sources have been concentrated on the skin disorders of lighter skin persons, little or nothing have been written on the persons with racial pigments. The aim of this research is to have a look on the non infectious skin disorders of persons with racial pigments and comparative dermatological diagnosis with lighter skin persons.

Purpose

To highlight some peculiarities of skin disorders in persons with racial pigments and comparisons with lighter skin persons.

Materials and methods

Analysis of literature sources devoted to the features of dermatological diagnosis in individuals with racial pigmentation in comparison with those in light skin patients.

Results

There were highlighted peculiarities and advantages of skin structure and functioning in patients with racial pigmentation, diseases of this group of persons were described. Some common skin diseases were found to be similar and some - different in persons with racial pigmentation and lighter skin persons.

Conclusion

There is need for a review of the present literature used by students to include all races so that some students like those from countries with prevailed population with racial pigmentation will be able to diagnose dermatological disorders in their fellow citizens .
