HUMAN CLONING: ATTITUDE TO THE PROBLEM

Scientific Supervisor Senior Teacher Busko E. V.

*The Department of Foreign Languages
Belarusian State Medical University, Minsk*

In the digital age, much of what could be found on the pages of science fiction novels, has become real. Medicine is no exception. But humanity is not ready to accept all discoveries. The question of human cloning remains unsolved. There is no consensus not only among the society and scientists, but also among doctors. Despite this, cloning processes are being studied and improved. Scientists have developed a method of Therapeutic cloning, which may soon solve the problem of finding donor organs and the consequences of their transplants.

In the report the process of cloning, the history of its origin and development, the attitude to the problem of cloning were considered. The main attention is paid to Therapeutic cloning. On the basis of the questioning, the attitude of doctors and students of the Belarusian State Medical University to Therapeutic cloning was determined, as well as the prospects for the development of the method in national medicine, which could improve the overall level of medical care.
