Introduction

Nowadays more and more attention has been paid to beauty, aesthetics and appearance. This desire of aesthetic beauty, as a rule, is the main reason for visiting a dentist and after that attention is drawn to the physiology of dental health.

Thus, orthodontic treatment becomes more popular. In a course of any medical intervention or treatment course, errors and complications can appear. Mistakes and complications in medicine are an objective reality that cannot be avoided and not circumvented. The urgency of the work is closely connected with the spread of ideas of orthodontic treatment both among the adult population and among children, therefore, in our opinion, a modern literate person should at least in general terms become familiar with undesirable treatment consequences on his own.

Aim of the study

1. to classify various errors by the field of development by the time of the assumption and by the degree of importance and also try to find the ways of their avoiding 2.to found out the role of a patient and a doctor on the treatment process; 3. to found out the influence of age on the result of orthodontic treatment, because most orthodontic patients are at the age when the maxillofacial system formation has ended, and the growth of the jaw bones has also comes to an end.

Materials and methods

We used methods of interviewing and questioning. As the result two interviews of our mates and acquaintances were also held. Firstly, the respondents answered the question whether they were seeking orthodontic help, and secondly, they told about the presence or absence of visible complications.

Results

The goals of the study are to classify possible errors, identify the ways of their prevention both by a doctor and patients, determine the necessary for orthodontic treatment, and search for the answer to the main question – if it is possible to carry out treatment without negative consequences and what is required for this?

Conclusions

Orthodontic treatment is necessary and useful for our dental health. The success of treatment depends both on the doctor's qualification and responsibility of a patient.
