

Life with human immunodeficiency virus

Kozlovskaya Anna Sergeevna, Surta Elizaveta Sergeevna

Belarusian State Medical University, Minsk Tutor - Zolotova Olga Vladimirovna, Belarusian State Medical University, Minsk

Introduction

Our research work shows today's urgent problem that is being discussed all over the world — human immunodeficiency virus. The increase of HIV (human immunodeficiency virus) positive people threatens modern society and appears to be the global problem.

Aim of the study

The aim of the research work is to show that HIV positive patients may lead an average life due to adequate therapy and the best way to stop the increase of HIV is to inform people about this disease.

Materials and methods

Different medical and scientific sources including foreign literature and websites have been analyzed. The students of BSMU and other universities have been questioned about their awareness of HIV and their attitude to people who suffer from HIV. We have studied various articles based on the problem of discrimination HIV positives in our country and compared it with latest publications in other countries.

Results

Some researches have showed that poor information of population about such actual problem as HIV lets HIV spread faster, forms stereotypes and causes discrimination. Deeper understanding of the existing problem can help to arrest and reduce the number of infected people.

Conclusion

In conclusion of our research work we inform people about this disease and try to show that HIV positives can lead a healthy way of life without discrimination.
