Рекомендовано Научно-методическим советом университета в качестве лабораторного практикума 20.02.2019 г., протокол № 6

Авторы: доц. Д. А. Черношей; доц. В. В. Слизень; доц. Т. А. Канашкова; ассист. И. А. Гаврилова

Рецензенты: канд. мед. наук, доц. В. Э. Бутвиловский; канд. мед. наук, доц. Е. И. Гудкова

Частная и клиническая микробиология = Special and clinical mi-Ч-25 crobiology : лабораторный практикум / Д. А. Черношей [и др.]. — 4-е изд. — Минск : БГМУ, 2019.-55 с.

ISBN 978-985-21-0261-2.

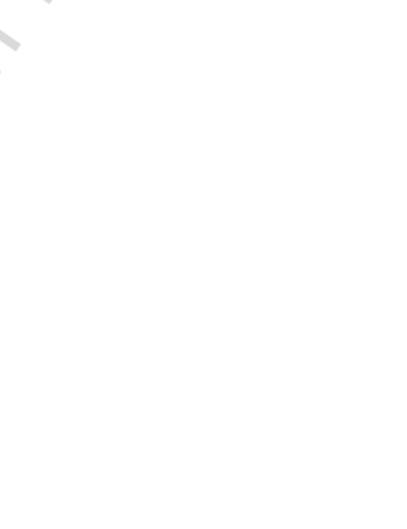

Содержит информацию для подготовки к практическим занятиям по разделам частной и клинической микробиологии. Приведены схемы, алгоритмы, справочные сведения, методики выполнения лабораторных работ. Первое издание вышло в 2015 году.

Предназначен для студентов 2-го курса медицинского факультета иностранных учащихся, обучающихся на английском языке.

The subject to study:

Staphylococci, systematics, general characteristics. Methods of microbiological diagnostics of staphylococcal infections. The material for the research depending on the form of the infection. Scheme of pure culture isolation (from pus, mucus, blood, etc.). Identification methods, phage typing. Specific prevention and treatment of staphylococcal infections.

Streptococci. Systematics. Pyogenic streptococci. Pneumococci. General characteristics. Antigenic structure. Acute and chronic diseases, pathogenesis, immunity. Specific antibodies to streptococcal antigens, diagnostic value. Methods for streptococcal infections diagnosis. Bacteriological method, study design. Material for studies depending on the form of the infection, the rules and methods for taking material. Principles of therapy and prevention pro-streptococcal infections.

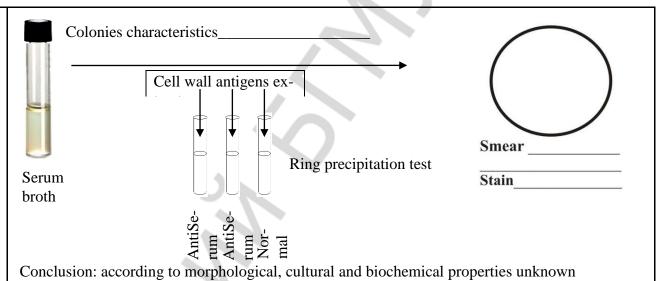

Neisseria. Systematics, general characteristics.

Characteristics of the causative agent, mechanisms of pathogenesis, immunity, methods of microbiological diagnosis of acute and chronic gonorrhea. Characteristics of the causative agent, mechanisms of pathogenesis, immunity, diagnosis and prevention of meningococcal infection-howl. sources:

<u>Class No. 2.</u> Microbiological diagnostics of acute enteric infections caused by enterobacteria
--

Date

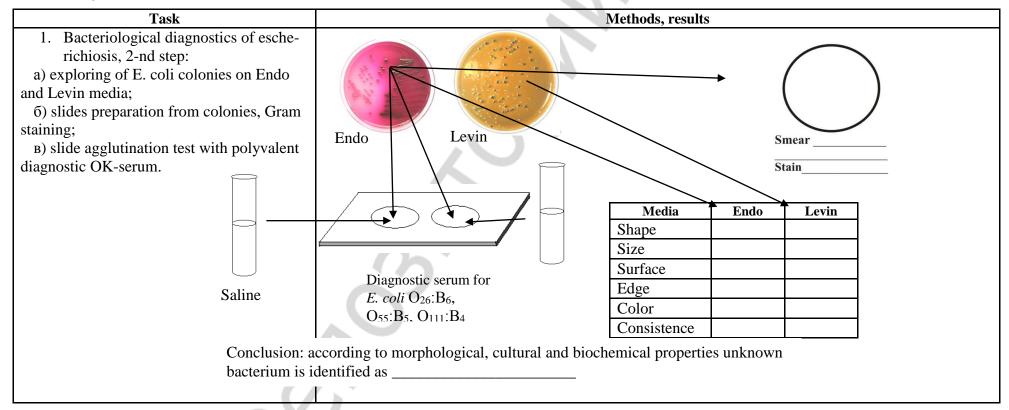

Questions to study: General characteristics of Enterobacteriaceae family. Differences between genera. General principles of diagnostics of acute enteric infections caused by pathogenic enterobacteria. Differential diagnostic media, composition, plinciple of work.

Escherichia, systematic position, general characteristics. The biological role of Escherichia coli. Molecular mechanisms of escherihiosis pathogenesis. Enteropathogenic, enterotoxigenic, enteroinvasive and enterohaemorrhagic Escherichia coli. Escherihisis diagnostics. Antibiotic treatment.

Salmonella, classification and general characteristics. Serological classification of Salmonella. Identification of Salmonella. Molecular biological typing.

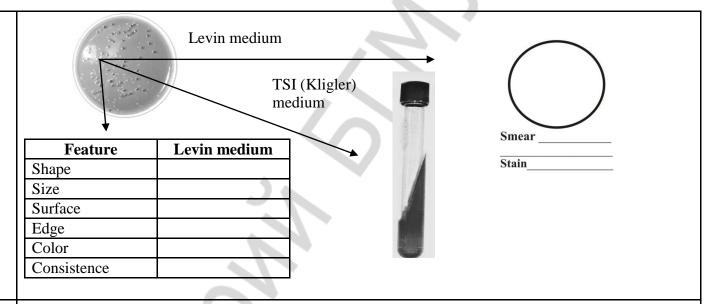

Causative agents of typhoid and paratyphoid. The pathogenesis of typhoid. Microbiological diagnostics of typhoid fever, depending on the stage of pathogenesis.

Laboratory work

- 2-nd step of coproculture isolation:
- a) describe colonies on Levin medium;
- b) prepare slide from colonies, Gram staining;
 - c) inoculate Kligler medium.

Demonstration.

- 1. Clean media: Endo, Levin Ploskirev, bismuth sulfite agar, Rapoport, magnesium, Kliglera.
- 2. The same media with the growth of
- E. coli, Salmonella, Shigella.
- 3. Biochemical Activity of E. coli and Salmonella.
- 4. Dendrograms of Salmonella molecular typing.
- 5. Tube agglutination test with killed E. coli culture.
- 6. The morphology of E. coli, Salmonella, Shigella (Gram staining).

Diagnosis of bacterial food poisoning

Food poisoning - acute systemic diseases resulting from ingestion of food, massively contaminated with microorganisms or microbial exotoxins. Food poisoning is divided into bacterial foodborne diseases and food poisoning (toxicosis), as well as poisoning of mixed etiology.

Foodborne diseases (FBD): FBDs result from ingestion of products massively colonized by certain bacteria. Pathogens: opportunistic members of the family Enterobacteriaceae - E. coli, Proteus (P. vulgaris, P. mirabilis), Morganella morganii, Citrobacter. Enterobacter, Hafnia, Klebsiella pneumoniae; Vibrionaceae Sem. V. parahaemolyticus; Sem. Bacillaceae - B. cereus, C. perfringens serovar A; Sem. Streptococcaceae faecalis: Sem. Pseudomonadaceae P. aeruginosa, and others.

Microbial food toxicosis (intoxication): acute illness arising from eating food, which containes a large amount of exotoxin (as a result of massive reproduction of microbes). These include botulism, toxicosis caused by staphylococcal enterotoxin, toxins from microscopic fungi and others.

Pathogenesis. Pathogen replicates in the intestine, penetrates into lymphoid tissue, where it is killed with the release of endotoxin, which causes damage to the intramural bowel NS, CNS and blood vessels. Bacteria cause inflammation of the intestinal wall.

Pathogenesis is based on the microbial exotoxin, which is not destroyed by food processing, digestive enzymes and acidic stomach contents.

Materials for the research: vomit, stomach washings, feces, urine, blood, sectional material (in the case of death), the remains of the suspected food, raw and semi-finished products used, daily samples of food, swabs and scrapings from kitchen utensils.

Lab. diagnosis: isolation of obligate pathogenic or opportunistic enterobacteria and Vibrio, staphylococci and their toxins, streptococci, bacillus, as well as (if indicated) - botulism pathogens and toxins.

To evaluate the etiologic role of opportunistic bacteria (OB) certain criteria are used.

Main criterion is quantitative: Etiologically significant number of OM is 10⁵-10⁶ or more CFU per 1g of material. The diagnosis is more reliable while simultaneous detecting same germs or toxins in suspected food. Other criteria are: repeated isolation of same germs from the material of the patient, the identity of the pathogen strains (serovars and phage-vars) in a large number of patients in group food poisoning, as well as the increase in antibody titer in the dynamics of the disease.

Class № 5. Microbiological diagnostics of diseases caused by Corynebacteria, bordetella, haemophilus, legionella, listeria Date_____

List of questions to study:

Corynebacterium diphtheria. Systematics, general characteristics of the pathogen. Types of Corynebacterium diphtheria, their distinctive features. Diphtheria toxin and antitoxic serum. The pathogenesis of diphtheria. Methods of microbiological and molecular biological diagnosis of diphtheria. Principles of therapy and prevention of diphtheria. Determination of the effectiveness of post-vaccinal immunity.

Bordetella pertussis. Characteristics of the pathogen, pathogenicity factors. Differentiation with parapertussis agent. The pathogenesis of pertussis, immunity, diagnostics. Principles of therapy and prevention of pertussis.

Haemophilus, general characteristics, role in human pathology.

Legionella, general characteristics, role in human pathology.

Listeria, general characteristics, role in human pathology.

Laboratory work

Tasks Methods. results 1. Bacteriological diagnosis of diphtheria, 2nd step: a) Describe the colonies Corynebacterium on potassium tellurite serum agar b) Seed bacteria from typical colonies onto Hiss media (glucose, sucrose, starch). Smear Smear Stain Tinsdale medium Stain Glucose Sucrose Starch Demonstration. 1. Corynebacterium diphtheriastained by: a) Neisser; b) Leffler. Colonies on serum tellurite agar **Feature** 2. Test for Corynebacterium diphtheria toxigenici-Shape Size 3. Preparations for specific prevention and treat-Surface ment of diphtheria and pertussis. Edge 4. Growth of Bordetella pertussis and parapertussis Smear Smear on CCA, NA with tyrosine, urease test. Color 5. Bordetella pertussis, Gram staining Consistency Stain Stain 6. Assessment of antidiphtheria immunity intensity

Flagella (motility)		
Gram staining		

Bordetella differentiation

Feature	B. pertussis	B. parapertussis

B. pertussis pathogenicity factors

Pathogenicity factors	Biological effect
Filamentous	Binds cell membrane glycolipid of ciliated airway epithelium, binds
hemagglutinin	surface R3 - glycoprotein receptor and initiates phagocytosis
	S1 Pertussin subunit ribosylates membrane protein Gi; toxin inhibits
Pertussis toxin (Per-	the activity of phagocytes and monocyte migration. S2 - subunit binds
tussin)	to the respiratory tract cell surface glycolipid; S3 - subunit binds to
	phagocytes surface gangliosides
Pili	Adhesion to the ciliated epithelium of the respiratory tract
Pertactin	Adhesion to the ciliated epithelium of the respiratory tract
Adenylate cyclase	Suppresses killing- activity of phagocytes and monocytes migration
Dermatonekrotoksin	Damages the skin and is lethal to laboratory animals
Tracheal toxin	peptidoglycan fragment - destroys ciliated cells of the respiratory
Tractical toxili	tract; stimulates interleukin-1 secretion (fever)
Endotoxin (LPS)	Activates complement and stimulate the production of cytokines

Date		
------	--	--

The list of questions to study:

14. B.anthracis spores, Ozheshko staining.

Classification and general characteristics of the especially dangerous infections. Demands to collection and transportation of biological material. Principles of diagnostics.

Vibrio cholerae, the systematic position. Classification and general characteristics, pathogenicity factors. Biovars. Differentiation from non-cholera vibrio. Pathogenesis of cholera. Methods of microbiological diagnostics. Rapid methods. Principles of treatment and prevention.

The causative agent of plague, systematic position, characteristics, pathogenicity factors. Differences from other Yersinia. Pathogenesis, principles of treatment and prevention of plague.

The causative agent of tularemia, systematics, general characteristics. Pathogenesis, principles of treatment and prevention.

Causative agents of brucellosis. Systematics and general characteristics, pathogenicity factors, pathogenesis. Microbiological diagnosis of brucellosis. Principles of treatment and prevention.

Anthrax. Systematics and general characteristics, pathogenicity factors. Differences from non-pathogenic bacilli. Pathogenesis. Microbiological diagnosis of anthrax. Principles of treatment and prevention.

Laboratory work

Tasks Methods, results **Demonstration.** 1. Growth of vibrio cholera on alkaline agar, TCBS, peptone water. 2. Phage lysability of vibrio cholera classica and El Tor. 3. Tube agglutination test. 4. Biochemical properties of V. cholerae. **Smear** Smear Smear Smear 5. Mobility of Vibrio spp. 6. V.cholera, pure culture, Gram staining. Stain Stain Stain Stain 7. I.pestis in the organs, Leffler staining. 8. The causative agent of tularemia (pure culture), Gram staining. 9. Preparations for specific prophylaxis of especially dangerous infections. 10. The causative agent of brucellosis, Gram staining. **Smear** Smear Smear Smear 11. The growth of Bacillus spp. on nutrient media. 12. B.anthracis in organs, Gram staining. Stain Stain Stain Stain 13. B.anthracis, pure culture, Gram staining.

List of questions to study:

Spirochetes, classification, general characteristics.

Treponema. Systematics and general characteristics. Pathogenesis and immunity in syphilis. Material for the study. Methods of microbiological diagnosis of syphilis. Principles of therapy and prevention of syphilis.

Fusospirochetosis pathogens

Leptospira. Systematics and general characteristics. Pathogenesis, methods of microbiological diagnostics, principles of treatment and prevention of leptospirosis.

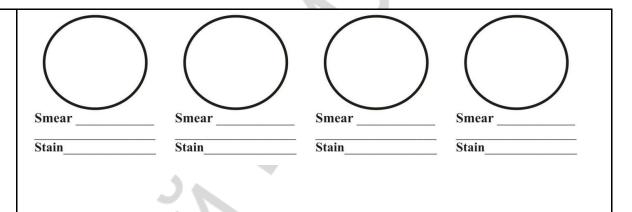

Borrelia. Systematics and general characteristics. Pathogenesis and methods of microbiological diagnosis of relapsing fever. The causative agent of Lyme borreliosis, principles of treatment and prevention.

Laboratory work

1. Perform the slide microprecipitation reaction (VDRL) for the syphilis serodiagnosis. 2. Assess ELISA (Wasserman test) for the syphilis diagnostics. Slide microprecipitation test 1. Patient serum 1:20 2. Saline sol. 3. Cardiolipin Ag 3. Cardiolipin Ag
Conclusion:

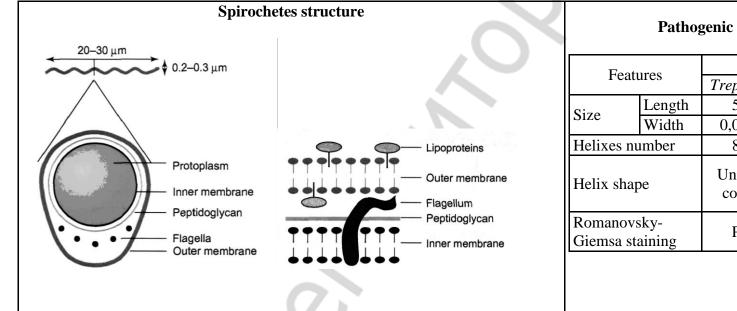

Demonstration.

- 1. Leptospires, dark field microscopy.
- 2. Borrelia in blood, Romanovsky-Giemsa staining.
- 3. Wasserman test (ELISA).
- 4. Treponema in dental plaque, Gram staining.
- 5. Treponema pallidum, pure culture, Romanovsky-Giemsa staining.

Pathogenesis of syphilis								
Disease stage	Period	Main pathogenetic mechanisms						
Primary								
Secondary								
Tertiary								

Serological diagnosis of syphilis:

CFT (Wasserman) with treponemal and cardiolipin antigens in primary syphilis becomes positive in the 6th week of the disease in 25-50% of patients, in 7-8 weeks - 75-90%. In secondary syphilis it is positive in 98-100% cases. In tertiary syphilis CFT is positive in only 60-70% patients. CFT for syphilis diagnostics has unsatisfactory sensitivity and specificity and is replaced now by ELISA. ELISA is the common used technics for syphilis diagnostics.

Confirmatory tests:

- treponema immobilization test is rather specific, but time and labor consuming, subjective, requires treponema culture;
- immunofluorescence (IF) with serum from patients. Screening tests: slide microprecipitation test, ELISA

Laboratory diagnosis of Lyme disease (Lyme borreliosis):

Microscopic method: dark-field microscopy (scrapings of skin lesions, plasma pellet, CSF, urine), microscopy of smears, impregnated with silver, IFT, and electron microscopy.

Cultural method: B. burgdorferi isolation is possible in 80% cases from skin lesions (1stage) on special nutrient media.

Molecular genetic methods: PCR allows the identification of the pathogen's DNA in the samples of the skin, blood, cerebrospinal fluid.

Serological: ELISA, indirect IFT, Western blot. Sometimes there are false-positive results due to cross-reactions among patients with syphilis, mononucleosis, rheumatoid arthritis and others.

General characteristics and classification of protozoa. Pathogenic representatives. Laboratory diagnosis of malaria, toxoplasmosis, amebiasis, giardiasis, trichomoniasis.

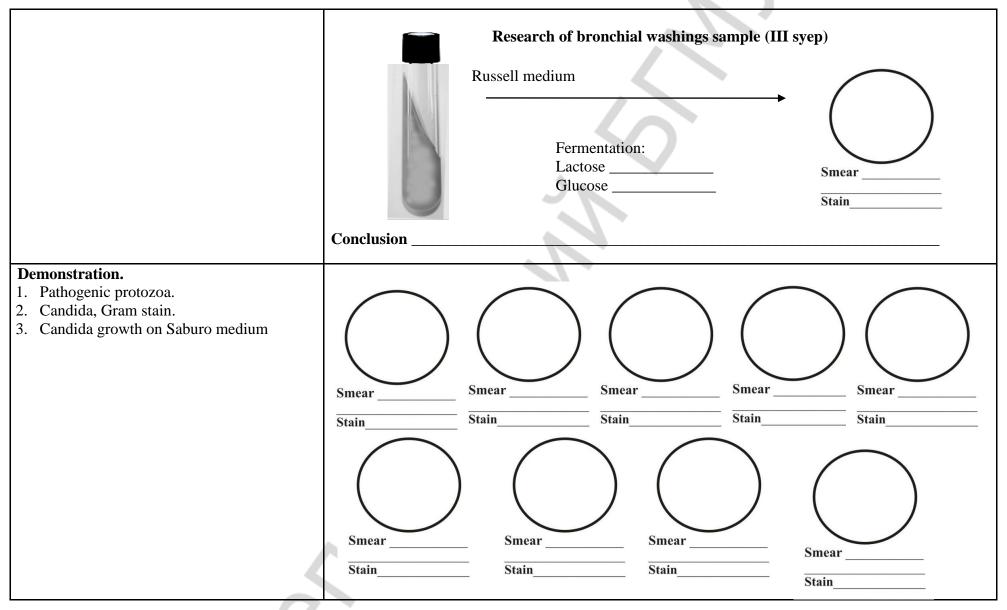

The causative agent of cryptosporidiosis.

Classification and general characteristics of fungi. Pathogens of ringworm, keratomycosis, deep mycoses. Candidiasis and conditions which promote its development. General principles of fungal infections diagnostics.

Pathogen of pneumocystosis.

Laboratory work

DIAGNOSTICS OF MYCOSIS

Microscopic method. High diagnostic value of the method caused by significant differences in fungal morphology, simplicity and speed of the research. The result can be obtained within 1-2 hours. Microscopy can be conducted in native preparations without staining. For visualization of the pathogen in the biological material which is poorly transparent (hair, skin, nails, etc.) it should be processed with 10-20% alkaline (KOH), which dissolves keratin and has no effect on the morphology of the fungal cells. Fixed smears may be stained by Gram (fungi are Gram-positive), Romanovsky-Giemsa, special techniques. Dimorphic fungi in biological material are in the form of yeast. Microscopy of histological preparations is also possible.

Serological method:

Immunofluorescence is sensitive, specific and rapid method based on the identification of fungal Ag in biological materials.

PHAT, latex agglutination, PT, CFT, ELISA are used to detect fungal antigens and antibodies in blood, CSF, urine. Serological reactions not always highly specific, but produce results earlier than culture method.

Culture (mycological) method. Most pathogenic fungi are mesophiles (20-45 °C) and not demanding for the nutrient medium. Optimal pH ranges from 4.0 to 6.5. Growing time depends on the kind of fungus and can be from several weeks to 2-3 days. The most frequently used medium is Saburo agar (peptone agar with glucose or maltose). The acidity of the medium and high carbohydrate content inhibits the growth of bacteria. Dimorphic fungi (pathogens caused subcutaneous and deep mycoses) grow in the mycelial form at 20-25 °C. The identification of a pure culture is carried out by morphological and biochemical characteristics.

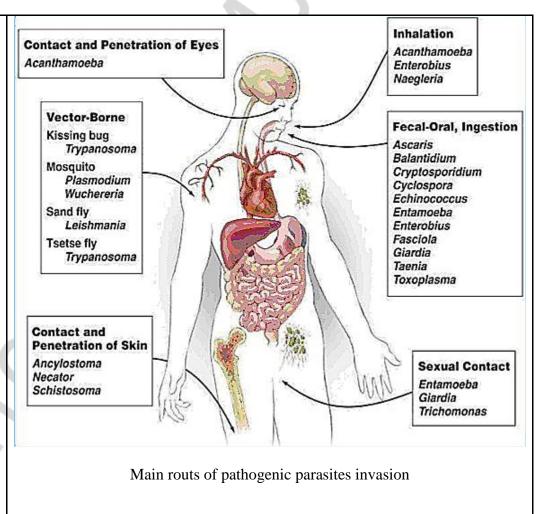

Allergic method. Skin tests are performed with fungal allergens (eg. Candide). Method is not very specific because of the group antigens presence.

Biological method. Bioassays in laboratory animals allow us to estimate the virulence of the pathogen, get in tissue culture of the fungus (usually in a form of yeast).

Molecular genetic methods. PCR and molecular hybridization are used. Among advantages - very high sensitivity and specificity, relative safety and short time needed for results.

The comparison of eu- and prokaryotic cell

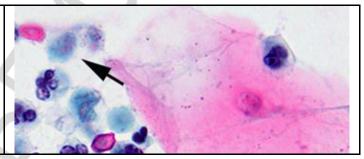

Main characteristics	Prokaryotic cell	Eukaryotic cell
Cell size	Average 0,2-2,0 mkm	
Nucleus	Does not have a true nucleus. Nucleoid, is not separated from the cytoplasm by a mem-	
	brane	
Chromosomes	Ring-like	
Number of chromosomes per cell	Usually one	
Mitochondria	No	
Endoplasmatic reticulum	No	
Ribosomes location	Dispersed in cyto- plasm	
Sedimentation constant	70S	
Teichoic asides in cell wall	Gram positive bacteria	
Peptidoglycane in cell wall	All bacteria with exception of mycoplasm	
Endospores	Some has	7
Division of cell	Binary (mitosis)	
Gametes, zygotes	No	

Protozoa belong to the domen – EUKARYA, kingdom – ANIMALIA, subkingdom – PROTOZOA, which includes 7 types, Four types of medical importance are showed in the tableu

Taxons	Representatives	Disease	Morphology
	AMOEBAE Entamoeba histolytica	Amebiasis	
TYPE SARCOMASTIGOPHORA subtype Sarcodina	Naegleria, acanthamoeba, hartmanella	Amoebic meningoencephalitis, keratitis	
	LEISHMANIA Leishmania species	Leishmaniasis	
subtype Mastigophora	TRYPANOSOMES Tripanosoma gambiense, Tripanosoma rodesiense Tripanosoma cruzi	African trypanosomiasis (sleeping disease) Chagas disease (American trypanosomiasis)	
	GIARDIA: Lamblia intestinalis (Giardia lamblia)	Diarrhea, malabsorption syndrome	

<u>Trichomonas</u> Trichomonas vaginalis Trichomonas vaginalis vaginitis, urethritis, prostatitis

TYPE – APICOMPLEXA class – Sporozoa

PLASMODIUM MALARIA:

Plasmodium vivax Plasmodium ovale Plasmodium malariae Plasmodium falciparum

TOXOPLASMA: Toxoplasma gondii	Toxoplasmosis	
SARCOCYST: Sarcocystis species	Sarcocystosis	Sarcocystis U 20um
ISOSPORA: Isospora species	Diarrhea	
CRYPTOSPORIDIUM: Cryptospodium species	Diarrhea	
CYCLOSPORA: Cyclospora cauetanensis	Diarrhea	10 jun
BABESIA: Babesia species	Babesiosis	

TYPE – CILIOPHORA class Kinetofragmino- phorea	BALANTIDIUM: Balantidium coli	Balantidiasis	
TYPE – MICROSPORA class Microsporea	MICROSPORIDIA: Encephalitozoon species Enterocytozoon species	Microsporidiasis	
	BLASTOCYST: Blastocystis hominis	V	Cyst G Granular Amoeboid

MICROBIOLOGICAL DIAGNOSTICS OF PROTOZOAN INVASIONS

<u>AMEBIASIS</u> Microscopic method. Materials: samples of faeces or exudates from abscesses. Smears are stained with iodine solution or hematoxylin. Tissue forms with phagocytized erythrocytes or quad cysts. can be identified. In native specimens characteristic motile vegetative forms can be noted. IF may be used for the identification of pathogen

Serological method: PHA test, ELISA, CFT, and other tests may be used. The highest antibody titer can be detected in extraintestinal amebiasis.

Some non-pathogenic amoeba are morphologically identical to Entamoeba histolytica. The differentiation is based on the enzymatic, immunological and molecular genetic analysis.

TRYPANOSOMES

Microscopic method. Materials: samples of blood, punctate from cervical lymphatic nodes, cerebrospinal fluid. Smears are stained by Romanovsky-Giemsa method.

Cultural method. Trypanosomes can be cultured on a nutrient medium with blood as well as in white mice or rats.

Serological method. The determination of specific IgM by ELISA is used.

TRICHOMONIASIS

Microscopic method. Materials: samples from urethral discharge, prostatic secretions or urine sediment are studied. Smears are stained by Romanovsky-Giemsa (trophozoite nucleus is violet-ruby, cytoplasm - blue and blefaroplast, flagella and aksostil - pink-red), methylene blue. IF is also used.

Cultural method. In chronic trichomoniasis pathogen can be cultured on nutrient media with protein. The method gives good results when confirmation of convalescence is needed.

<u>TOXOPLASMOSIS</u> Microscopic method. Materials: biopsy, samples of body fluids (blood, cerebrospinal fluid, lymph node puncture, etc.). Smears are stained by Romanovsky-Giemsa method. Toxoplasma Ags may be detected by IF test.

Cultural method. Cultivation of Toxoplasma is possible in cell cultures and chicken embryo.

Serological method. Detection of specific IgM indicates the early stages of the disease. IgG peaks at 4-8 week of disease. ELISA is widely used.

Biological method. Mice are infected in the abdominal cavity or intracranially. They usually succumb 7-10 days after infection. The pathogen is identified microscopically or by serological method.

LEISHMANIASIS

Microscopic method. Materials: skin lesions (bumps, ulcers), bone marrow. Smears are stained by Romanovsky-Giemsa method. The detection of amastigote (nucleus and kinetoplasts are of red-purple color and cytoplasm is bluish) is of importance. IFT is also used.

Cultural method. Leishmania can be cultured on blood agar.

Biological method. Infection of mice or hamsters is possible.

Serological method. Specific antibodies may be detected by CFT, passive hemagglutination or ELISA.

Allergic method. Skin test with leishmania Ags may be used.

GIARDIASIS

Microscopic method. Materials: feces, duodenal secretion. In smears cysts or vegetative forms, can be detected. Iodine staining is usually used. IFT is also applicable.

Cultural method. Giardia can be cultured nutrient media.

Serological method. Specific antibody titers are higher in symptomatic giardiasis.

MALARIA

Microscopic method. Smears of blood are stained by Romanovsky-Giemsa method. Various forms of pathogen can be identified (red nucleus, blue cytoplasm).

Differentiation of species is carried out by morphological features of parasites and parasitized erythrocytes.

Serological method. Specific antibodies are detected by ELISA. IFT is applicable for diagnostics. **Molecular genetic method**. PCR.

BALANTIDIASIS

Microscopic method. Microscopy of smears from feces under low magnification allows to reveal large motile balantidiums.

Cultural method. Possible, but rarely used
